

Crash Data

The system provides two Crash Data windows:

- The Crash Data for Viewing window contains crash data acquired directly from the separate crash reporting system for the county selected at the top of the window. It provides such information as the location of a crash and the vehicles and people involved.
- The Crash Data for Screening window contains the crash data from the Crash Data for Viewing window that is processed for use in screening analysis. It adds crash filters that provide additional information to the acquired data such as type of crash.
