

List Data Windows

The data from list data tables is generally displayed in a simple window that shows the values that appear in a particular drop-down list. These are generally found in the Setup menus of the various modules.

To insert a new record into a list data table, select a parent activity and select **Add** or **Insert** from the right-click or Actions menu. Enter the data for the relevant columns and select **Save Data**. To delete an entry, select the entry and select **Delete** from the right-click or Actions menu. You can only delete items that have not been used in any records in the AgileAssets system.

As with location-referenced data tables, you may choose to display the data in grid view or record view. See [Data View of Location-referenced Data](#) for more information.
