

Full Mode Report - Events

The **Full Mode Report - Events** report provides a comparison of the events in the system as it was just prior to and after running the interface. This is primarily used with Full Mode interface to create a record of the results of the interface run. Only changed events are shown in this report.

The report is divided into sections for each event table and data year.

Each changed event is displayed in its own row containing the following information:

- **Source Table** – The type of event this row represents. You can sort, or filter based on this field.
- **Data Year** – The year data if it is available.
- **Location ID** – The identifier for the location of this event.
- **Previous: Route Name** – The name of the route associated with this event as it was just prior to running the interface.
- **Previous: From Measure** – The beginning measure of the event as it was just prior to running the interface.
- **Previous: To Measure** – The end measure of the event as it was just prior to running the interface. For point events this is the same as the **Previous: From Measure** field.
- **New: Route Name** – The name of the route associated with this event as it exists in the buffer table that was loaded by the interface.
- **New: From Measure** – The beginning measure of the event as it exists in the AgileAssets system at the time of report generation.
- **New: To Measure** – The end measure of the event as it exists in the AgileAssets system at the time of report generation.
