

Add a Node to a Performance Model

Note: You can only add children to a node if unused decision variables are available.

To add a branch to an existing node in the **Default Model Structure** window, follow the steps below:

1. Right-click the node to which the branch will be added
2. Select **Add**
 - If the node did not have any existing child nodes, the system creates two new child nodes. Each child node will be given the default description of No Model.
 - If the node already had child nodes, then the system will create only one new child node. This child node will be given the default description of No Model.
